                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   14-DEC-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     intact and infectious proviruses are present. The porcine retroviral sequence can be used to generate probes to determine the level (e.g. sequences) of intact (i.e. potentially replicating) porcine provirus copy number) of intact (i.e. potentially replicating) porcine provirus sequences in a strain of xenograft transplantation donors. It can be used to detect mutations, genetic lesions or viral recombinants and to used to detect mutations, genetic lesions of activated retrovirus. Using determine the histological localisation of activated retrovirus. Using replymerase Chain Reaction DNA Quantitation (pDQ) on blood mononuclear polymerase Chain Reaction bnA Quantitation (pDQ) on blood mononuclear cells, infectivity titration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or a lower copy number of viral elements could be selected.

envelope genes. Probes and primers can be derived from the envelope (env) genes of PERV-A and PERV-B. The probes and primers are used in a method to detect retroviruses in a sample of porcine/human tissue, cultivated in the presence of a porcine cell line, or human tissue from a patient with a xenotransplant. Subtype of PERV in a sample containing one of the PERV env genes can also be determined. The present sequence encodes a Pig endogenous retrovirus (PERV)-B envelope protein. PERV exists in two different subtypes, PERV-A and PERV-B. The differences are reflected in sequence divergence in the

The present invention provides a method to prevent the transmission of infectious agents during xenotransplantation. This involves introducing to donor swine cells a recombinant DNA encoding a peptide fragment from the infectious agent, and then introducing these cells into the transplant recipient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mat_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Porcine retrovirus.
                                                                                            infectious proviruses are present. The porcine retroviral sequence can be used to generate probes to determine the level (e.g. copy number) of intact (i.e. potentially replicating) porcine provirus sequences in a strain of xenograft transplantation donors. It can be used to detect mutations, genetic lesions or viral recombinants and also to determine the histological localisation of activated retrovirus. Using polymerase chain Reaction DNA Quantitation (PDQ) on blood mononuclear cells, infectivity titration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or a lower copy number of viral elements could be selected.
                                                                                                                                                                                                                                          containing the putative coding regions for viral GAG, POL and ENV proteins. This sequence and PCR fragments generated from it (see AAT74812-T74882) can be used to screen organs for the presence of porcine retroviruses prior to xenotransplantation. Transplantation can increase the likelihood of retroviral activation if intact and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         14-DEC-1995;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO9721836-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mat_peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ωy
                                                                                          The present invention relates to a method for screening a cell or tissue for the presence or expression of a retrovirus (RV), comprising contacting a target nucleic acid from the cell or tissue with a second nucleic acid from the present invention (e.g. the present sequence or a fragment thereof). The method is useful for RV detection and to assess graft transplantation risk. Screening of animals allows the elimination of donors with active replication of known viruses. Inactive proviruses can be detected and inactivated, allowing identification and elimination of potential human pathogens derived from swine in a manner not possible in the outbred human organ donor population and is important to the development of human xenotransplantation.

```
The present sequence encodes a Pig endogenous retrovirus (PERV)-B envelope protein. PERV exists in two different subtypes, PERY-A and PERV-B. The differences are reflected in sequence divergence in the envelope genes. Probes and primers can be derived from the envelope (env) genes of PERV-A and PERV-B. The probes and primers are used in a method to detect retroviruses in a sample of porcine/human tissue, particularly primary porcine tissue and human cell lines that have been cultivated in the presence of a porcine cell line, or human tissue from a patient with a xenotransplant. Subtype of PERV in a sample containing one of the PERV env genes can also be determined.
                                                                                                                                                                                                                                            Pig endogenous retrovirus; PERV-A; envelope protein; PERV-B; subtype; probe; primer; detection; retrovirus; human tissue; xenotransplant; primary porcine tissue; human cell line; porcine cell line; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method to prevent the transmission of infectious agents during xenotransplantation. This involves introducing to donor swine cells a recombinant DNA encoding a peptide fragment from the infectious agent, and then introducing these cells into the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WO200071726-A1
                                                                                               The present invention provides a method to prevent the transmission of infectious agents during xenotransplantation. This involves introducing to donor swine cells a recombinant DNA encoding a peptide fragment from the infectious agent, and then introducing these cells into the

                                                                          AAC67019 standard; DNA; 7362 BP
                                                                                                                                                                                                                                                                 The present invention relates to a method for screening a cell or tissue for the presence or expression of a retrovirus (RV), comprising contacting a target nucleic acid from the cell or tissue with a second fragment thereof). The method is useful for RV detection and to assess of donors with active replication of known viruses. Inactive proviruses of potential human pathogens derived from swine and inactivated, allowing identification and elimination in the outbred human organ donor population and is important to the development of human xenotransplantation.

The porcine retroviral sequence can be used to generate probes to determine the level (e.g. copy number) of intact (i.e. potentially replicating) porcine provirus sequences in a strain of xenograft transplantation donors. It can be used to detect mutations, genetic lesions or viral recombinants and to detect mutations genetic lesions or viral recombinants. Using the histological localisation of activated retrovirus. Using
                                                                                                                                                                                                                                                                                                                                                                                                                                                           This cDNA sequence represents a defective purified swine retrovirus found in PK-15 cells containing the putative coding regions for viral GAG, POL and ENV proteins. There are a few in frame stop codons and apparent frame shifts in the given coding sequence which alter features of the translation. This sequence and PCR fragments generated from the sequence (see AAT74812-T74882) could be used to screen organs for the presence of porcine retroviruses prior to xenotransplantation.
                                                                                                                                                                                                                                                                         Sequence 7393 BP; 2004 A; 1801 C; 1896 G; 1692 T; 0 other;
                                                                                                                                                                                                                                                                                                   Polymerase Chain Reaction DNA Quantitation (PDQ) on blood mononuclear cells, infectivity titration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or a lower copy number of viral elements could be selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid from porcine retro:viruses - used for detecting viruses in transplant or other tissue and for assessing risk of transmitting infection to graft recipient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mat_peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       intact (i.e. potentially replicating) porcine provints sequences in a strain of xenograft transplantation donors. It can be used to detect mutations, genetic lesions or viral recombinants and also to determine the histological localisation of activated retrovirus. Using Polymerase Chain Reaction DNA Quantitation (PDD) on blood mononuclear cells, infectivity titration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or a lower copy number of viral elements could be selected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              containing the putative coding regions for viral GAG, POL and ENV proteins. This sequence and PCR fragments generated from it (see AAT74812-T74882) can be used to screen organs for the presence of porcine retroviruses prior to xenotransplantation. Transplantation can increase the likelihood of retroviral activation if intact and infectious proviruses are present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid from porcine retro:viruses - used for detecting viruses in transplant or other tissue and for assessing risk of transmitting infection to graft recipient

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CDS
                            for porcine retroviruses prior to xenotransplantation. Transplantation can increase the likelihood of retroviral activation if intact and infectious proviruses are present. The porcine retroviral sequence can be used to generate probes to determine the level (e.g. copy number) of intact (i.e. potentially replicating) porcine provirus sequences in a strain of xenograft transplantation donors. It can be used to detect mutations, genetic lesions or viral recombinants and to determine the histological localisation of activated retrovirus. Using Polymerase Chain Reaction DNA Quantitation (PDQ) on blood mononuclear cells, infectivity titration and susceptibility testing can be performed. Ultimately animal donors without intact porcine retroviral sequences or with a lower copy number of viral elements could be selected.
                                                                                                                                                                                                                                               This sequence represents the purified porcine retroviral cDNA sequence of Tsukuba-1 and contains the putative coding regions for viral proteins GAG, POL and ENV. This sequence and PCR fragments generated from the sequence (see AAT74812-T74882) could be used to screen organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-DEC-1996;

The method is useful for RV detection and to assess graff transplantation risk. Screening of animals allows the elimination of donors with active replication of known viruses. Inactive proviruses of potential human pathogens derived from swine in a manner not possible in the outbred human organ donor population and is important to the development of human xenotransplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                graft transplantation risk. Screening of animals allows the elimination of donors with active replication of known viruses. Inactive proviruses can be detected and inactivated, allowing identification and elimination of potential human pathogens derived from swine in a manner not possible in the outbred human organ donor population and is important to the development of human xenotransplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 8132 BP; 2248 A; 1977 C; 2037 G; 1870 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 contacting a target nucleic acid from the cell or tissue with a second nucleic acid from the present invention (e.g. the present sequence or a fragment thereof). The method is useful for RV detection and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Assessing risk of endogenous retroviruses in clinical practice and in xenotransplantation, comprises using probe sequences derived from swine or miniature swine retroviral genome -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for screening a cell or tissue

POlynucleotide encoding porcine retrovirus expression product -
PT useful to develop products for use in vaccines, diagnosis and
PT veno-transplantation

XX

Claim 4; Fig 2; 69pp; English.

XX

CC This DNA sequence encodes the porcine retrovirus (PoEV) virion core
CC polypeptide (GAG), polymerase (POL) and envelope (ENV) proteins. These
CC proteins can be used to develop viral vaccines, antisense nucleic acids,
CC ribozymes and other antiviral agents. They can also be used in
